

Axpo Hydro Digital – Digital Compass

The digital Compass for hydropower operator

Situation analysis with a focus on operations and maintenance of existing power plants

With the Digital Compass, Axpo supports the evaluation of the current state of your organisation and identifies possible courses of action for the digital transformation of your power plants. We base our gap analysis on the target state set by Axpo itself as the largest hydropower operator in Switzerland.

As an optional extra, we can assess the potential benefits of introducing the new digital way of working specifically for your power plants. To do this, we use the findings from our Hydro 4.0 program.

The process involves assessing and evaluating the effect of 40 digital measures on six areas of action.

With the Digital Compass, every hydropower operator can assess their current situation and ensure their progress on the path towards the digital future is managed based on accurate information.

The Digital Compass has a modular structure and consists of the following components:

Foundation

Includes current-state analysis in the kick-off workshop, GAP analysis and prioritized digital transformation measures.

Option 1

The extended current-state analysis includes an organisation-wide online survey to provide a broad basis for determining the current state.

Option 2

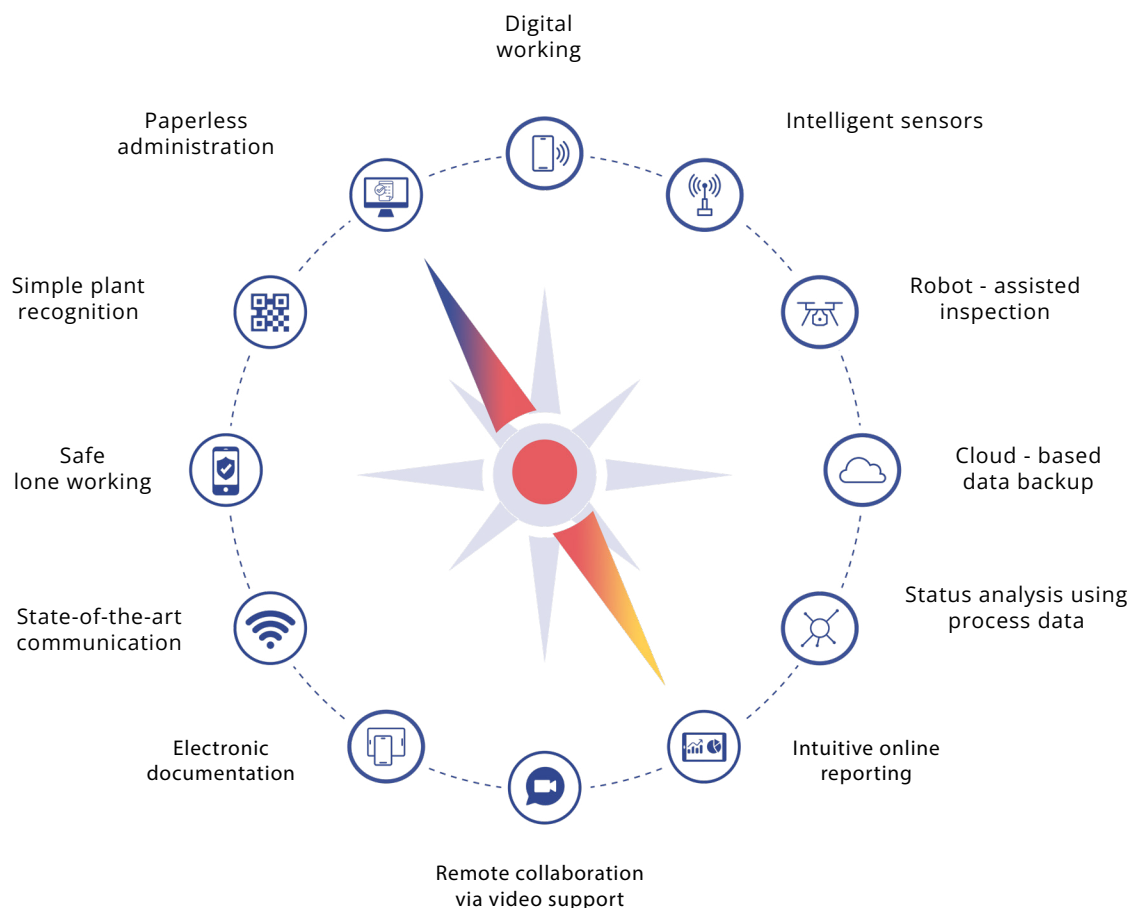

Potential benefits analysis includes a quantitative estimation of the financial benefits of digital transformation for your organisation.

If necessary, we would be happy to supplement these modules in order to meet your individual needs.

The efficient analysis process is predominantly carried out digitally. Already during the kick-off session, a comprehensive and guided current-state analysis is carried out. Further input can be added online.

The total costs for the Digital Compass amount to CHF 12,000–20,000.
